

Gym City - Gym, Yoga, Dance or Fitness Studio

HTML Template

Created: 20/06/2018

Updated: 18/06/2020

By: AmaxCode

Demo: <https://gym-city.amaxcode.com>

Thank you for purchasing this theme. If you notice any inaccuracy in the documentation please feel free to email us at amaxcode@gmail.com.

Table of Contents

- A. [Application Structure](#)
- B. [HTML Files and Structure](#)
- C. [SCSS Files and Structure](#)
- D. [JavaScript Files and Structure](#)
- E. [Running a local development copy](#)
- F. [Changing a theme color](#)
- G. [Creating a production version](#)
- H. [Sources and Credits](#)

A) Application Structure - [top](#)

"public" folder

There is a production version with minified files in this folder. If you want to see a quick preview of the template, just double-click "index.html".

"app" folder

There is a development version of the app this folder. We've done our best to make it as structured and simple to modify as possible. So you won't find huge all-in-one files here. All the sections of the app have their own component-like folder with html/scss/javascript/images that are used in this section and only in this section. So you can easily find, remove, modify or integrate any part of the app.

The "app" folder structure:

- **"index.html"** is a main HTML file. Each page have it's own html file, i.e **"contacts.html"** for Contacts page. We'll talk more about HTML files in this project in [HTML Files and Structure](#) section.
- **"index.scss"** is a main scss file. We'll talk more about SCSS files in [SCSS Files and Structure](#) section.
- In **"favicon"** folder you'll find favicon files.
- In **"css"** folder there are common scss files that are used throughout all the app. We'll talk more about SCSS files in [SCSS Files and Structure](#) section.
- In **"js"** folder there are common JavaScript files. We'll talk more about JavaScript files in this project in [JavaScript Files and Structure](#) section.
- In **"vendor"** folder there are vendor files that are not listed as dependencies in "package.json".
- In **"partials"** folder there are components that are used in all the pages. In every component folder you'll find only files that are related to this component. So if for example you decide to remove one of them you won't affect any other part of the app. And it's really easy to modify any of the sections because you'll easily find all the related code.
- In **"pages"** folder there is code related to the content of each page of the app. For example in **"pages/contacts"** there is only the code that is used for Contacts page content.

"gulpfile.js" file and "gulp" folder

Gulp is a toolkit which we use to automate the build process of this app. [Learn more about Gulp](#)

"package.json" and "package-lock.json" files

These files hold various metadata relevant to the project. There is information to npm that allows it to handle the project's dependencies. Learn more about [package.json](#), [package-lock.json](#)

B) HTML Files and Structure - [top](#)

Each page of the template have it's own html file in the root of the "app" folder, i.e "app/contacts.html" for Contacts page. We're using [gulp-file-include](#) to make the app structure more comprehensive and easy to modify. For example this line of code `@@include('partials/loading/loading.html')` tells the gulp task to include html code from the "app/partials/loading/loading.html" file. To avoid repeating code on each page we've also have a separate file for page HEAD and scripts. It's "app/partials/head.html" and "app/partials/scripts.html". And this code in "scripts.html" file

```
@@if (env === 'dev') {  
  <script src="/vendor.js"></script>  
  <script src="/app.js"></script>  
}  
  
@@if (env === 'prod') {  
  <script src="/scripts.min.js"></script>  
}
```

tells the gulp task to include "vendor.js" and "app.js" files if it's a development version of the app and "scripts.min.js" if it's a production version. You can find a production version of html files when it's built in the "public" folder.

All the html files in the template are well-structured and easy to follow.

C) SCSS Files and Structure - [top](#)

[Sass](#) is a style sheet language that enables you to use things like variables, nested rules, inline imports and much more. We're using SCSS syntax. In this app all the `.scss` files are compiled into `.css` by gulp task.

"app/index.scss" is the main scss file. All the scss files that are used in this app are imported here. If you want to add another scss file you should add `@import 'file_path/file_name.scss'` in this file.

In the **"app/css/variables.scss"** file you'll find all the global scss variables that are used in the template. For example you can easily change all the text color in the project by simply changing `$text-color` value in the variables.scss file. Or if you would like to change the main color of the app, just change the value of `$action-color`.

In the **"app/css/mixins.scss"** file you'll find the mixins that are used in the template. For example:

```
@mixin desktop-layout {  
  @media (min-width: 768px) {  
    @content;  
  }  
}
```

You can use this mixin to specify styles for desktop screens like this:

```
.event-info {  
  margin-bottom: 20px;  
  
  @include desktop-layout {  
    margin-bottom: 0;  
  }  
}
```

In this case the element will have `margin-bottom: 20px;` on small devices and `margin-bottom: 0;` on the devices with minimum width 768px.

In the **"app/css/main.scss"** file you'll find the common styles. In the **"app/css/tooltip.scss"** there are styles for tooltips. And in the **"app/css/buttons.scss"** there are styles for buttons.

Each section have it's own scss file in the **"app/partials"** or in the **"app/pages"** folder. So it's easy to navigate and change the styles of any section.

"gulp/gulp-styles.js" is a gulp file that helps us to build scss to css and to automate some of the routine tasks such as adding vendor prefixes or css minification.

So yes, you don't need to add vendor prefixes (like `-webkit-`, `-moz-`) by hand. It will be added automatically by [autoprefixer](#).

All the vendor css files are included to the project in "vendor-css" task in "gulp/gulp-styles.js" file. If you want to add a new vendor css file, just add it like this:

```
'./node_modules/bootstrap/dist/css/bootstrap.css'.
```

D) JavaScript Files and Structure - [top](#)

[Jquery](#) and [Popper.js](#) are used in this project mainly because it's required by [Bootstrap 4](#). [ScrollIt.js](#) is used for a nice scrolling functionality when you click "Get a free 3 day pass" button on the homepage. [Animate on Scroll](#) is here to animate elements in the template as you scroll. And [Owl Carousel 2](#) is used for carousels.

All the vendor JavaScript files are included to the project in "vendor-js" task in "**gulp/gulp-scripts.js**" file. If you want to add a new vendor JavaScript file, just add it to the task like this:

```
'./node_modules/jquery/dist/jquery.js'.
```

[Google Maps API](#) is used in the map section of the templates. In the "**app/contacts.html**" please change the `key=AI...` to your own google map api key to see the map on the contacts page. You'll find how to get your google map api key [here](#).

In the "**app/js/main.js**" file you'll find a code to initialise common elements that are used in the template. And some of the components in "**app/partials**" and in "**app/pages**" folder have it's own JavaScript file to handle it's behaviour.

E) Running a local development copy - [top](#)

1. If you don't have any of these tools installed already, you will need to:
 - Install Node.js and NPM <https://nodejs.org/en/download/>
 - Install the gulp command line utility `npm install --global gulp-cli`.
Please check out the documentation if you have any issues installing gulp <https://gulpjs.com/docs/en/getting-started/quick-start>.
2. From your local folder run `npm install`
3. After all npm modules are successfully installed run `npm start`
4. Run `gulp serve` in a separate terminal to watch changes
5. Change the `key=AI...` in the "app/contacts.html" file to your own google map api key to see the map on the contacts page. You'll find how to get your google map api key [here](#).

If you've done your best trying to run the app but it still doesn't work feel free to contact us at amaxcode@gmail.com.

Some notes about making changes to the local copy:

- You don't need to reload the page when you make any changes to scss files. The page will be updated automatically.
- Although the JavaScript files are combined into one you can still easily debug it because source map is used to preserve the mapping between your source code and the bundled one.
- If you add or remove vendor files you'll need to rerun `gulp serve`.
- If you add or change any image you'll need to rerun `gulp serve`.

F) Changing a theme color - [top](#)

The default color theme of the template is pink. If you would like to change it - just change the value of `$action-color` in the “`variables.scss`” file. You can either pick one of the preset values like `$blue-theme` or set your own color.

G) Creating a production version - [top](#)

To create a production ready version with minified files run `gulp release`. It will update a “**public**” folder which can be deployed to your server.

H) Sources and Credits - [top](#)

Images and icons

All images in [Demo](#) are used for preview purpose only and NOT included in the final purchase files. You can buy the images we've used on depositphotos.com:
